Spectrum Malaria Antigen Test (Whole Blood) For Plasmodium falciparum & vivax

REF: 1150 001  25 Card Test
REF: 1150 002  50 Card Test

INTENDED USE
For the rapid qualitative determination of Malaria P. falciparum & P. vivax specific lactate dehydrogenase (pLDH) in human blood for the diagnosis of Malaria infection.

Background
Malaria is a serious parasitic disease characterized by fever, chills and anemia and is caused by a parasite that is transmitted from one human to another by the bite of infected Anopheles mosquitoes. There are four kinds of malaria that can infect humans: Plasmodium falciparum, P. vivax, P. Ovale, and P. Malaria. In humans, the parasites (called sporozoites) migrate to the liver where they mature and release another form, the merozoites. The disease now occurs in more than 90 countries worldwide, and it is estimated that there are over 500 million clinical cases and 2.7 Million malaria-caused deaths per year. At present, malaria is diagnosed by looking for the parasites in a drop of blood. Blood will be put into a Microscope slide and stained so that the parasites will be visible under a Microscope.

Assay Principle
Spectrum Malaria Antigen Test contains a membrane strip, which is pre-coated with two monoclonal antibodies as two separate lines across a test strip. One monoclonal antibody (test line 1) is specific to the P. vivax (pLDH) and another monoclonal antibody (test line 2) is specific to (pLDH) of P. Ovale. Conjugate pad is dispensed with monoclonal antibodies conjugated to the colloidal gold, which are specific to P. vivax & P. Ovale (pLDH).

The Spectrum Malaria Antigen Test is designed for the differential diagnosis between Plasmodium falciparum and Plasmodium Vivax.

Precautions and Warnings
For professional in vitro diagnostic use only. Do not use after expiration date. Do not eat, drink or smoke in the area where the specimens or kits are handled. Handle all specimens as if they contain infectious agents. Observe established precautions against microbiological hazards throughout testing and follow the standard procedures for proper disposal of specimens. Wear protective clothing such as laboratory coats, disposable gloves and eye protection when specimens are being tested. Humidity and temperature can adversely affect results.

STORAGE & STABILITY
The kit can be stored at room temperature or refrigerated (4-30°C). The test device is stable through the expiration date printed on the sealed pouch. The test device must remain in the sealed pouch until use. DO NOT FREEZE. Do not use beyond the expiration date.

MATERIALS:
Materials Provided:
Test Device
Assay Buffer
Sample Dropper

Materials Not Provided:
5µl Pipette

SPECIMEN COLLECTION & PREPARATION
(Collection by venipuncture)
1. Collect whole blood into a collection tube containing EDTA, citrate or heparin) by venipuncture.
2. If specimens are not immediately tested, they should be refrigerated at 2-8°C. For storage periods greater than three days, freezing is recommended. They should be brought to room temperature prior to use. Using the specimen after long-term storage more than three days can cause non-specific reaction.
3. When stored at 2-8°C, the whole blood sample should be used within three days.

(Collection using a lancet)
1. Clean the area to be lanced with an alcohol swab.
2. Squeeze the end of the fingertip and pierce with a sterile lancet provided.
3. Wipe away the first drop of blood with sterile gauze or cotton.
4. Take a sample pipette provided, and while gently squeezing the tube, immerse the open end in the blood drop and then gently release the pressure to draw blood into the sample pipette up to the black line.

Directions for use:
Add whole blood (5 µl) into sample well “S”
Add 2 drops or 60-80 µl of assay buffer to well “A”
Read Result in 20 mins.
Note

Optimal assay performance requires strict adherence to the assay procedure described in this instruction sheet and any deviations from the procedure may lead to aberrant results.

DIRECTIONS FOR USE

1. Add 5 µl of whole blood into sample well ("S" small well) (Do not use excess blood).
2. Add two drops or 60-80 µLs of assay buffer into developer well ("A").
3. Read the test result at 20 mins.

INTERPRETATION OF RESULTS

1) P. falciparum Positive reaction
The presence of two color bands (C and 1) indicates a positive result for P.falciparum.

2) P. vivax Positive reaction
The presence of two color bands (C and 2) indicates a positive result for P. vivax. The pLDH present in the sample reacts with the pan anti-pLDH conjugate and moves through the test strip where the pLDH is captured by Ovale specific anti-pLDH.

3) Negative reaction
The presence of only one band within the result window indicates a negative result.

4) Invalid
The test is invalid if the C line does not appear. If this occurs, the test should be repeated using a new cassette.

LIMITATIONS

1. The test procedure, precautions and interpretation of results for this test must be followed when testing.
2. Anti-coagulants. heparin, EDTA, and citrate do no affect the test result.
3. This test kit detects Plasmodium lactate dehydrogenase in patient whole blood and is useful as a screening procedure for malaria diagnosis.
4. Do not mix reagent of different lots.
5. The test is limited to the detection of antigen of Malaria Plasmodium vivax & ovale. Although the test is very accurate in detecting pLDH, a low incidence of false results can occur. Other clinically available tests are required if questionable results are obtained. As with all diagnostic tests, a definitive clinical diagnosis should not be based on the results of a single test, but should only be made by the physician after all clinical and laboratory findings have been evaluated.
